

Install Open Pose Editor:

Paste this Link „ <https://github.com/fkunn1326/openpose-editor> „ under Extras into install from URL

Then click on „check for Update“ and restart UI.

there is also a more complex 3d openpose mode, but the one shown above is more than enough.

Fast Tutorial:

<https://www.youtube.com/watch?v=5z71oxf8kh4>

Installing Control Net

First download the models found following the link:

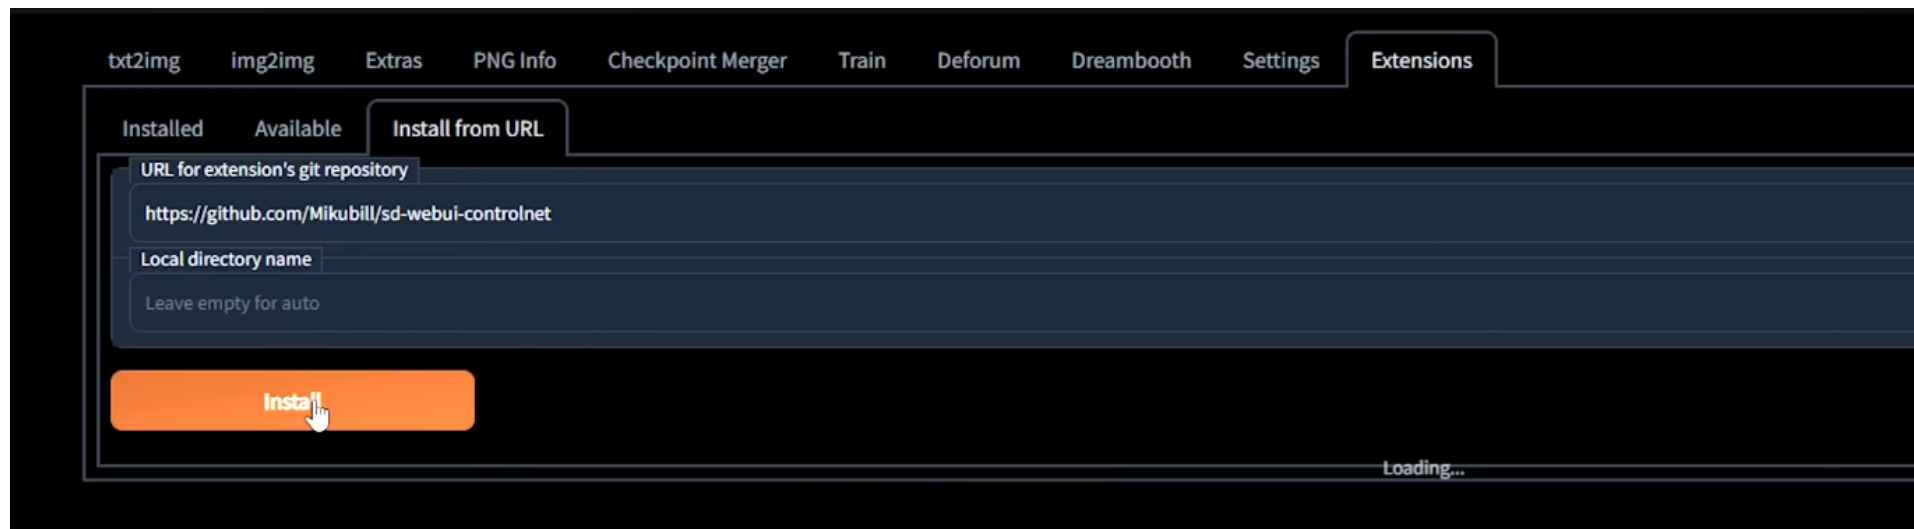

<https://civitai.com/models/9251?modelVersionId=11004>

Open the Comand Window (type cmd) and after locating your SDWEBUI Folder type:

```
pip install opencv-python
```

```
C:\sdwebui>pip install opencv-python
```

Then you have to install thsi link from URL : <https://github.com/Mikubill/sd-webui-controlnet>

then“Apply and Restart UI“

Afterwards copy all your Control net files you downloaded ind the beginning into this Folder

```
<< sdwebui > extensions > sd-webui-controlnet > models
```

Combine 2 Control Nets

<https://www.youtube.com/watch?v=cNIHZInV3mg&t=223s>

Open source text Ai:

<https://www.youtube.com/watch?v=w41-MUfxIWo>

We are using an extra piece of software to create **LORAs** for Stable diffusion, ist a similar process that Lensa.ai uses to produce your Portraits in different Styles and Outfits.

Choose A Foto - scale it with BIRME to 512 x 512 or 768 x 768, then under „Train“ -- Preprocess Images -- use Blip for caption (Input und Output folder.)

Now in a more detailed way:

Go to https://github.com/bmaltais/kohya_ss copy the following comand ,, git clone https://github.com/bmaltais/kohya_ss.git
cd kohya_ss
.\setup.bat ,,

and run it in the terminal (cmd). Wait a few minutes and then answer the questions as below:

```
In which compute environment are you running?
```

```
This machine
```

```
-----  
Which type of machine are you using?
```

```
No distributed training
```

```
Do you want to run your training on CPU only (even if a GPU is available)? [yes/NO]:no
```

```
Do you wish to optimize your script with torch dynamo?[yes/NO]:no
```

```
Do you want to use DeepSpeed? [yes/NO]: no
```

```
What GPU(s) (by id) should be used for training on this machine as a comma-seperated list? [all]:all
```

```
-----  
Do you wish to use FP16 or BF16 (mixed precision)?
```

```
fp16
```

```
accelerate configuration saved at C:\Users\ohmni/.cache\huggingface\accelerate\default_config.yaml
```

```
(venv) PS C:\Users\ohmni\AI\SUPERSD\Kohya\kohya_ss>
```

If you have a certain Graphics card you can do the next step

Optional: CUDNN 8.6

This step is optional but can improve the learning speed for NVidia 30X0/40X0 owners... It allows larger training batch size and faster training speed

Due to the filesize I can't host the DLLs needed for CUDNN 8.6 on Github, I strongly advise you download them for a speed boost in sample generation (almost 50% on 4090) you can download them from here:

<https://b1.thefileditch.ch/mwxKTEtellLolbMbruuM.zip>

To install simply unzip the directory and place the `cuda_windows` folder in the root of the kohya_ss repo.

Run the following command to install:

```
.\venv\Scripts\activate  
python .\tools\cudann_1.8_install.py
```

afterwards go to the Kohya_ss folder and start gui.bat

```
Running on local URL: http://127.0.0.1:7861
```

```
To create a public link, set `share=True` in `launch()`.
```

Like with Stable Diffusion paste this URL in your browser and go on.

Now it comes to choosing the images you want to train your Lora with. anything goes, if you are using google us „large“ in image search.

Then go to Birme.net and scale the selected images to 512x512 or 768 x 768

Bulk Image Resizing Made Easy 2.0

BIRME is a flexible and easy to use bulk image resizer. It can resize your images to any specific dimension and crop them proportionately if necessary. It's an online tool and you don't need to download or install on your computer. BIRME is absolutely free to use.

DROP YOUR IMAGES HERE

- OR -

BROWSE FROM YOUR COMPUTER

[\(Looking for version 1?\)](#)

RESIZE / CROP

RENAME

SAVE AS ZIP

SAVE FILES

REMOVE ALL

RESET SETTINGS

Now it comes to choosing the images you want to train your Lora with. anything goes, if you are using google us „large“ in image search.

Then go to Birme.net and scale the selected images to 512x512 or 768 x 768.

Go to the Kohya Gui to create automated Caption for each image:

Dreambooth Dreambooth LoRA Dreambooth TI Finetune Utilities

Captioning Convert model Extract DyLoRA Extract LoRA Extract LyCORIS LoCON Merge LoRA Merge LyCORIS Resize LoRA

Basic Captioning BLIP Captioning GIT Captioning WD14 Captioning

This utility will use BLIP to caption files for each images in a folder.

Image folder to caption
Directory containing the images to caption

Caption file extension: .txt

Prefix to add to BLIP caption: (Optional)

Postfix to add to BLIP caption: (Optional)

Batch size: 1

Use beam search

Number of beams: 1

Top p: 0,9

Max length: 75

Min length: 5

Caption images

Afterwards open the caption files and input your Trigger Word for the Lora (something very specific Like Hansiiii or Corrrrrggiii) and you could even improve the automated Caption manually.

Now ist time to create 3 Folders: Image
Log
Model

In the „Image Folder“ we need a new Folder with a number in its name.
The number comes from 1500 (minimum trainingsteps) divided by the amount of images we have (but the number should be at least 100)

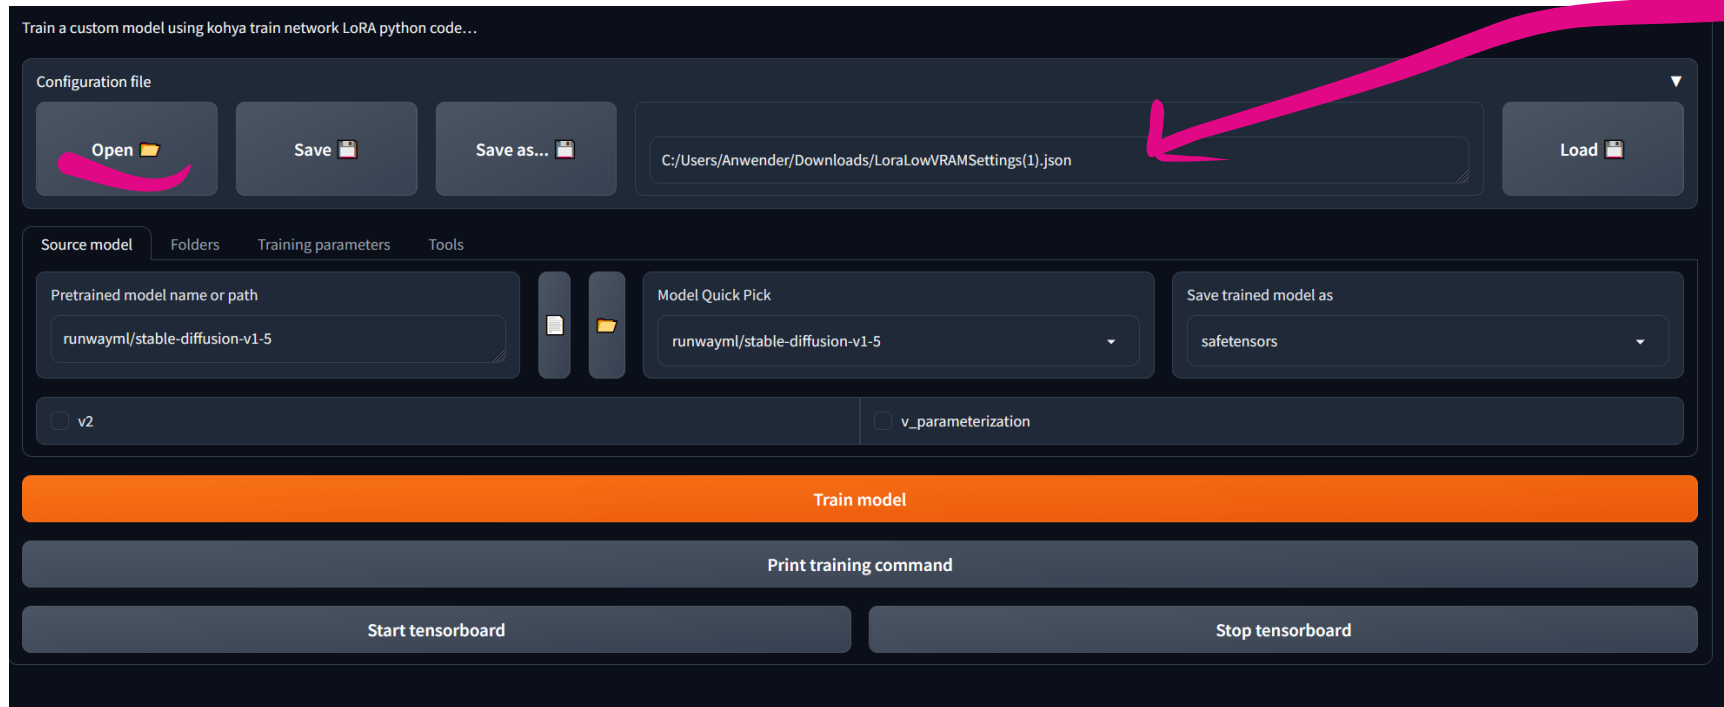

> Image > 100_Doskozilla

Finally training can begin:

At first we need 1 of 2 diff settings files:

<https://mega.nz/file/ndFRwTIB#-T-6AKXtK8Xa8VZGzNAjARNUyGTj2qEYSLp7zePDOIs>

<https://mega.nz/file/zFNjlJAL#uB2uTAvCqLohSUzYBgtuBcAMt4Jnclg6jVV5YE4s0F4>

Link the corresponding folders and you can train right away

Train custom model using kohya train network LoRA python code...

Configuration file

Open Save Save as... Load

C:/Users/Anwender/Downloads/LoraLowVRAMSettings(1).json

Source model Folders Training parameters Tools

Image folder
E:/Dropbox/Uni IA/KI/Skript/processed/Doskozilla Lora/Image/100_Doskozilla

Regularisation folder
(Optional) Folder where where the regularisation folders containing the images are located

Output folder
E:/Dropbox/Uni IA/KI/Skript/processed/Doskozilla Lora/model

Logging folder
E:/Dropbox/Uni IA/KI/Skript/processed/Doskozilla Lora/log

Model output name
Doskozilla2

Training comment
(Optional) Add training comment to be included in metadata

Train model

Print training command

Start tensorboard Stop tensorboard

LoRA type
Standard

LoRA network weights
{Optional} Path to existing LoRA network weights to resume training

Train batch size
1

Epoch
1

Save every N epochs
1

Caption Extension
.txt

Mixed precision
fp16

Save precision
fp16

Number of CPU threads per core
2
 Cache latent

Seed

Learning rate
0.0001

LR Scheduler
constant

LR warmup (% of steps)
0

Optimizer
AdamW8bit

Optimizer extra arguments
{Optional} eg: relative_step=True scale_parameter=True warmup_init=True

Text Encoder learning rate
5e-5

Unet learning rate
0.0001

Network Rank (Dimension)
128

Network Alpha
alpha for LoRA weight scaling
128

Max resolution
The maximum resolution of dataset images. W,H
512,512

Stop text encoder training
After what % of steps should the text encoder stop being trained. 0 = train for all steps.
0

Allow non similar resolution dataset images to be trained on.
 Enable buckets

Advanced Configuration

Sample images config

Train model

mit guter GPU kann man das auf 768 x768 erhöhen

Advanced Configuration

Weights

Blocks

Conv

Down LR weights

Specify the learning rate weight of the down blocks of U-Net.

(Optional) eg: 0,0,0,0,0,0,1,1,1,1,1,1

Mid LR weights

Specify the learning rate weight of the mid block of U-Net.

(Optional) eg: 0.5

Up LR weights

Specify the learning rate weight of the up blocks of U-Net. The same as down_lr_weight.

(Optional) eg: 0,0,0,0,0,0,1,1,1,1,1,1

Blocks LR zero threshold

If the weight is not more than this value, the LoRA module is not created. The default is 0.

(Optional) eg: 0.1

No token padding

Gradient accumulate steps

1

Enable weighted captions in the standard style (token:1.3). No commas inside parens, or shuffle/dropout may break the decoder.

Weighted captions

Prior loss weight

1

LR number of cycles

(Optional) For Cosine with restart and polynomial only

LR power

(Optional) For Cosine with restart and polynomial only

Additional parameters

(Optional) Use to provide additional parameters not handled by the GUI. Eg: --some_parameters "value"

Keep n tokens

0

Clip skip

2

Max Token Length

75

Full fp16 training (experimental)

Gradient checkpointing

Shuffle

Memory efficient attention

Use xformers

Color au

Min SNR gamma

0

Don't upscale bucket resolution

Bucket resolu

64

crop

Noise offset (0 - 1)

(Optional) eg: 0.1

Dropout caption every n epochs

0

Rate of caption dropout

0

VAE batch size

0

Save training state

Resume from saved training state

path to "last-state" state folder to resume from

Max train epoch

(Optional) Override number of epoch

Max num workers for DataLoader

1

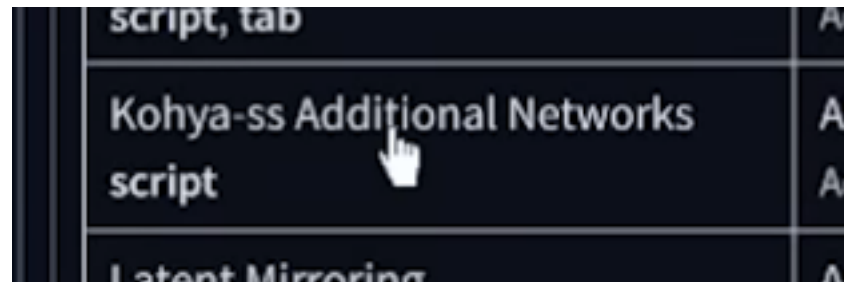

Check this if you have a weaker GPU

Go to the Loras mdoel folder und copy the file to the following folder:

sdwebui > models > Lora

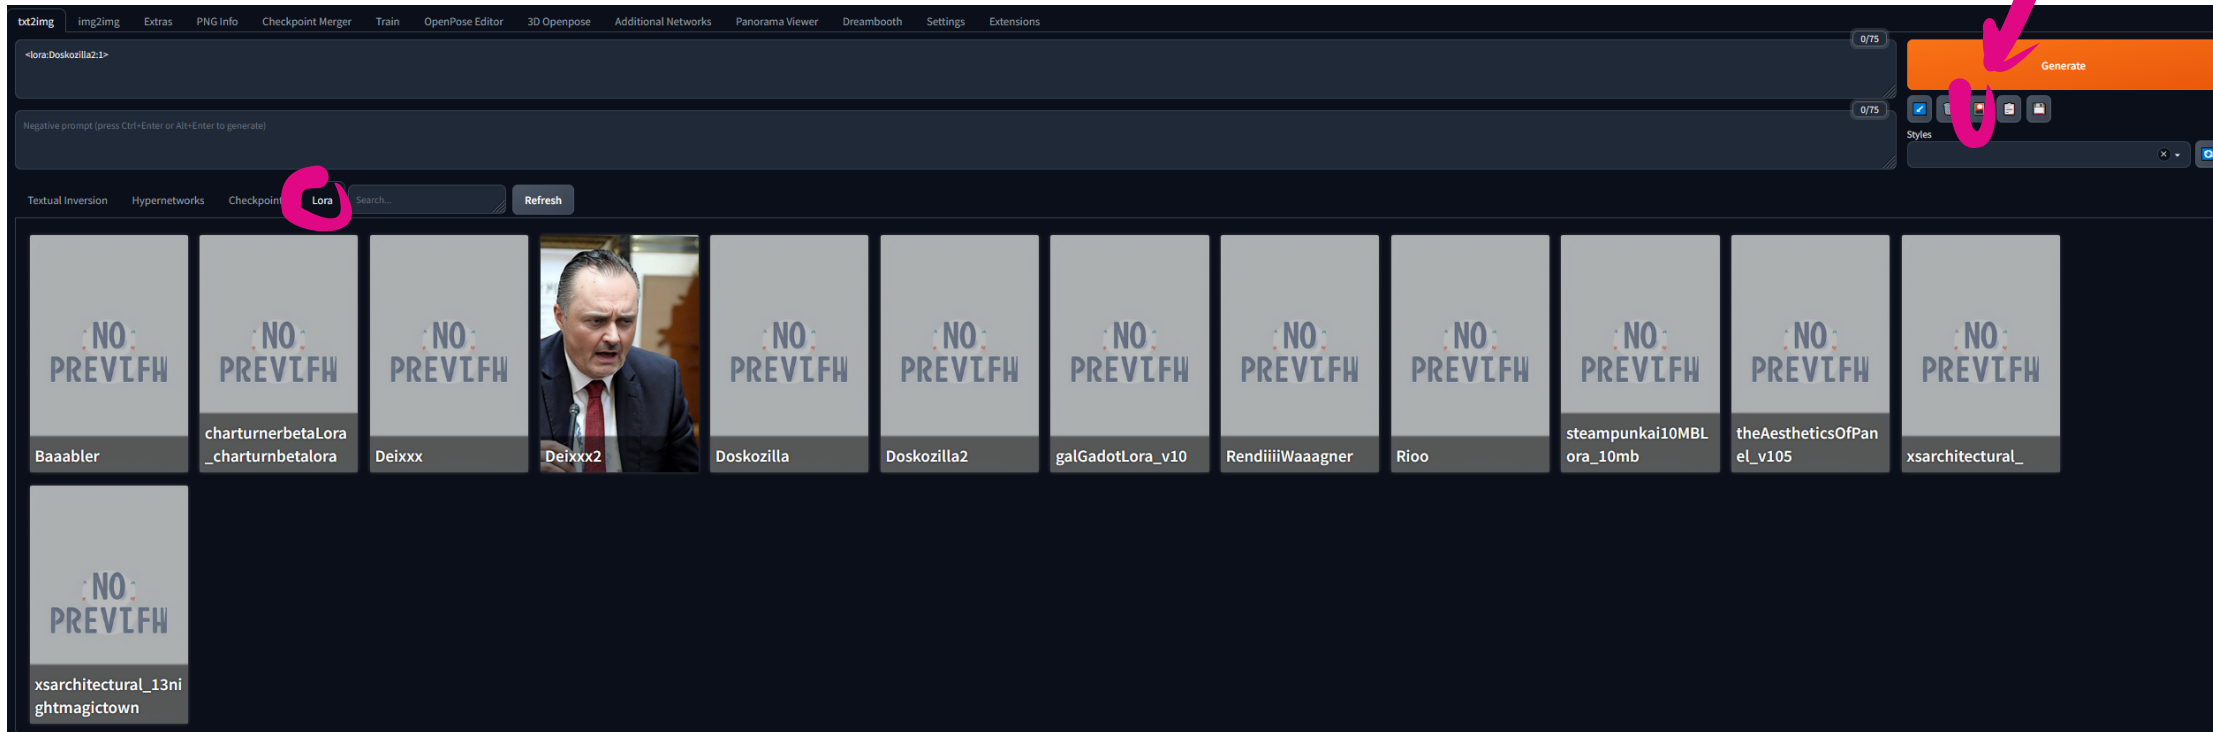

Now one last extension is needed

In SD Extras go to Extension - Load from Adress, load it and then activate

Now you can load your Loras, choose them and you will see your trigger word appearing. The number signifies the strength of your special lora, mostly it's advised to decrease it to 0.9- to get the best results.

You can also combine different Loras but the sum of the Lora weight numbers always has to add up to 1. (e.g.: 0.3, 0.3 and 0.4)

Now you can load your Loras, choose them and you will see your trigger word appearing. The number signifies the strength of your special lora, mostly it's advised to decrease it to 0.9- to get the best results.

You can also combine different Loras but the sum of the Lora weight numbers always has to add up to 1. (e.g.: 0.3, 0.3 and 0.4)

Process of building a good prompt

Iterative prompt building

You should approach prompt building as an iterative process. As you see from the previous section, the images could be pretty good with just a few keywords added to the subject.

I always start with a simple prompt with subject, medium, and style only. Generate at least 4 images at a time to see what you get. Most prompts do not work 100% of the time. You want to get some idea of what they can do statistically.

Add at most two keywords at a time. Likewise, generate at least 4 images to assess its effect.

Using negative prompt

You can use an [universal negative prompt](#) if you are starting out.

Adding keywords to the negative prompt can be part of the iterative process. The keywords can be objects or body parts you want to avoid (Since v1 models are not very good at rendering hands, it's not a bad idea to use "hand" in the negative prompt to hide them.)

You can adjust the **weight** of a keyword by the syntax `(keyword: factor)`. `factor` is a value such that less than 1 means less important and larger than 1 means more important.

For example, we can adjust the weight of the keyword `dog` in the following prompt

dog, autumn in paris, ornate, beautiful, atmosphere, vibe, mist, smoke, fire, chimney, rain, wet, pristine, puddles, melting, dripping, snow, creek, lush, ice, bridge, forest, roses, flowers, by stanley artgerm lau, greg rutkowski, thomas kindkade, alphonse mucha, loish, norman rockwell.

Increasing the weight of `dog` tends to generate more dogs. Decreasing it tends to generate fewer. It is not always true for every single image. But it is true in a statistical sense.

() and [] syntax

(This syntax applies to AUTOMATIC1111 GUI.)

An equivalent way to adjust keyword strength is to use `()` and `[]`. `(keyword)` increases the strength of the keyword by a factor of 1.1 and is the same as `(keyword:1.1)`. `[keyword]` decrease the strength by a factor of 0.9 and is the same as `(keyword:0.9)`.

You can use multiple of them, just like in Algebra... The effect is multiplicative.

```
(keyword): 1.1
```

```
((keyword)): 1.21
```

```
((keyword)): 1.33
```

Similarly, the effects of using multiple `[]` are

```
[keyword]: 0.9
```

```
[[keyword]]: 0.81
```

```
[[[keyword]]]: 0.73
```

Keyword blending

(This syntax applies to AUTOMATIC1111 GUI.)

You can mix two keywords. The proper term is prompt scheduling. The syntax is

[keyword1 : keyword2: factor]

factor controls at which step keyword1 is switched to keyword2. It is a number between 0 and 1.

For example, if I use the prompt

Oil painting portrait of [Joe Biden: Donald Trump: 0.5]

for 30 sampling steps.

That means the prompt in steps 1 to 15 is

Oil painting portrait of Joe Biden

And the prompt in steps 16 to 30 becomes

Oil painting portrait of Donald Trump

The factor determines when the keyword is changed. it is after $30 \text{ steps} \times 0.5 = 15 \text{ steps}$.

The effect of changing the factor is blending the two presidents to different degrees.

You may have noticed Trump is in a white suit which is more of a Joe outfit. This is a perfect example of a very important rule for keyword blending: The first keyword dictates the global composition. The early diffusion steps set the overall composition. The later steps refine details.

Blending faces

A common use case is to create a new face with a particular look, borrowing from actors and actresses. For example, [Emma Watson: Amber heard: 0.85], 40 steps is a look between the two:

When carefully choosing the two names and adjusting the factor, we can get the look we want precisely.

Poor man's prompt-to-prompt

Using keyword blending, you can achieve effects similar to prompt-to-prompt, generating pairs of highly similar images with edits. The following two images are generated with the same prompt except for a prompt schedule to substitute `apple` with `fire`. The seed and number of steps were kept the same.

The factor needs to be carefully adjusted. How does it work? The theory behind this is the overall composition of the image was set by the early diffusion process. Once the diffusion is trapped in a small space, swapping any keywords won't have a large effect on the overall image. It would only change a small part.

castle, **blue sky background**

wide angle view of castle, blue sky background

By adding more describing keywords in the prompt, we narrow down the sampling of castles. In We asked for **any image of a castle** in the first example. Then we asked to get only those with a blue sky background. Finally, we demanded it is **taken as a wide-angle photo**.

The more you specify in the prompt, the less variation in the images.

Attribute association

Some attributes are strongly correlated. When you specify one, you will get the other. Stable Diffusion generates the most likely images that could have an unintended association effect.

Let's say we want to generate photos of women with **blue eyes**.

a young female with **blue eyes**, highlights in hair, sitting outside restaurant, wearing a white outfit, side light

Blue eyes

What if we change to brown eyes?

a young female with **brown eyes**, highlights in hair, sitting outside restaurant, wearing a white outfit, side light

Brown eyes

Nowhere in the prompts, I specified ethnicity. But because people with blue eyes are predominantly Europeans, Caucasians were generated. Brown eyes are more common across different ethnicities, so you will see a more diverse sample of races.

Stereotyping and bias is a big topic in AI models. I will confine to the technical aspect in this article.

Embeddings are keywords

Embeddings, the result of textual inversion, are nothing but combinations of keywords. You can expect them to do a bit more than what they claim.

Let's see the following base images of Ironman making a meal without using embeddings.

Prompt: iron man cooking in kitchen.

Style-Empire is an embedding I like to use because it adds a dark tone to portrait images and creates an interesting lighting effect. Since it was trained on an image with a street scene at night, you can expect it adds some blacks AND perhaps buildings and streets. See the images below with the embedding added.

Style-Empire is an embedding I like to use because it adds a dark tone to portrait images and creates an interesting lighting effect. Since it was trained on an image with a street scene at night, you can expect it adds some blacks AND perhaps buildings and streets. See the images below with the embedding added.

Prompt: iron man cooking in kitchen **Style-Empire**.

Note some interesting effects

- The background of the first image changed to city buildings at night.
- Iron man tends to show his face. Perhaps the training image is a portrait?

So even if an embedding is intended to modify the style, it is just a bunch of keywords and can have unintended effects.

Embeddings explained:

Effect of custom models

Using a custom model is the easiest way to achieve a style, guaranteed. This is also a unique charm of Stable Diffusion. Because of the large open-source community, hundreds of custom models are freely available.

When using a model, we need to be aware that the meaning of a keyword can change. This is especially true for styles.

Let's use Henry Asencio again as an example. In v1.5, his name alone generates:

Using DreamShaper, a model fine-tuned for portrait illustrations, with the same prompt gives

It is a very decent but distinctly different style. The model has a strong basis for generating clear and pretty faces, which has been revealed here.

So make sure to check when you use a style in custom models. van Gogh may not be van Gogh anymore!
